SET UP AND RUN

## 20+ YEARS OF INDUSTRY LEADERSHIP

vti is at the core of virtually every major ate tester

VTI's signal switch/measure and control components are employed worldwide in a broad spectrum of applications for aerospace, defense, telecommunications, test and measurement, contract manufacturing, automotive, medical, and commercial functional test.

VTI presides over the VXIbus consortium, co-founded the LXI standard, and is an active member of many other consortiums that drive test and measurement industry standards. Our commitment to long-term open-platform standards has enabled system integrators to develop common ATE systems that are not impacted by the effects of obsolescence using standard products that are designed to maintain active production status in excess of 15 years.

The EX1200 is our next generation family that leverages our reputation for delivering innovative, modular high-density designs with common hardware and software architectures that can be leveraged throughout the life cycle of a product.

Leading Supplier of Data Acquisition<br>Hardware and Software

## LXI - The T\&M Standard for Ethernet

LXI EXTENDED FUNCTIONS

In 2005, VTI cofounded LXI*, an industry standard for Ethernet-based test instrumentation, and is also the industry leader in open platform switching solutions. LXI stands for LAN eXtension for Instrumentation. It extends on traditional LAN, adding instrument interoperability requirements, timing and synchronization options, and enhanced performance, that makes it ideal as an instrumentation platform

The EX1200 family incorporates LXI core technology as well as optional extended function capabilities, to take full advantage of the benefits the specification offers. The EX1200 family's powerful synchronization and triggering capabilities provide the confidence that it can be integrated within any LXI, GPIB, PXI or VXI hybrid system

- Distributed switching and measurement systems over LAN
- Synchronized measurement data to IEEE 1588 precision
- Highly deterministic hardware-based triggering using the LXI Wired Trigger Bus
- Protection against PC bus obsolescence
- Assurance of multi-vendor instrument interoperability
- Scalable solutions that optimize rack space
- LAN eXtensions for Instrumentation

## OVERVIEW

The EXI 200 product family is a modular and scalable series of multifunction switch/measure units that can be configured to address a variety of applications in the mechanical data acquisition and electronic test environments.
this family contains the following core components:

## MAINFRAMES

plug-In CARDS
ACCESSORIES and connectivity

## Plug-in Cards

- general purpose and multiplexer

SWITCHING $300 \mathrm{~V}, 3$ A
COMPARATOR/THRESHOLD

- power switching up to 16 A

RF/microwave switching

- SOURCES / TACHOMETER / COUNTERS
- rtd simulator - digital I/O
nerninnurns
Mainframes
- PROVIDING POWER TO the plugin cards
analog bus for routing measurements FROM PLUGIN CARDS TO DMM

Slots for inserting plug-in
cards for specific functionality

LXI wired trigger bus for
precision synchronization
with other instruments.
a shared communication bus AND SYSTEM CLOCK

5-lane analog bus capable of routing signals up to $300 \mathrm{~V}, 3 \mathrm{~A}$ internally to the DMM for measurement.

- Optional 6.5 digit DMM capable of
measuring $\mathrm{DCV}, \mathrm{ACV}, \mathrm{DCl}, \mathrm{ACl}$ $2 \mathrm{~W} \Omega, 4 \mathrm{~W} \Omega$, temperature transducers and frequency.

Robust I/O Interface

- connectivity options give users convenient and easy methods to connect the il to the instrument

LXI interface allows users to control instrument and acquire data using Ethernet

## A Single, Modular, Scalable Solution

## High-Density Switching and Data Acquisition Systems

APPLICATIONS

- High-performance switching for ATE, DC to 26.5 GHz
- Power supply switching
- Temperature monitoring (RTD thermocouple, thermistor)
- Automotive ECM testing
- High voltage monitor
- Data logging applications
- Cable/harness testing
- Battery test
- RTD/sensor simulation
- White Goods Testing

## HIGHLIGHTS

- Modular, scalable architecture in half and full rack $1 \cup, 3 U$ and $8 U$ versions provides low cost-per-channel across a wide range of channel count
- Small footprint for switching/scanning applications with up to 5762 -wire channels in 10
- Optional EXLab "Set Up and Run" software simplifies data acauisition and analysis
- Measurement support for all thermocouple types, RTDs, and thermistors with built-in cold junction compensation
- Scan list architecture, tightly synchronized with internal 6.5 digit DMM increases test throughput
- Analog and digital plug-in modules provide control capability of external device
- Multiple callibration sets yield more accurate data across temperature range (up to eight per module)
- LXI communication interface eliminates platform obsolescence and support cost concerns
- Tightly synchronized measurements in a distributed architecture using IEEE 1588
- Highly deterministic handshaking using the LXI Wired Trigger Bus
- Web-based access for monitoring and control of devices, from anywhere in the world. using any web-enabled device

## Data Acquisition

switch/measure and control for data acquisition
When installed with the optional 6.5 digit DMM, the Ex1200 family can be configured as a cost-effective, high-density, scanning measurement and control instrument capable of acquiring data from thermocouples, RTDs, thermistors, and voltage/current sensors at rates up to 1000 samples per second.

Plug-in switch/multiplexer modules are used to expand the number of channels that can be scanned in a single system. Additional plug-in modules extend the capabilities of this instrument for data acquisition by adding precision analog and digital outputs for controlling external devices, as well source/fach for measurements on rotating machinery.

MEASUREMENT CAPABILITY

terminal blocks
Terminal blocks provide wired cable assemblies with screw terminal breakout points that allow users to probe connections between instruments.

## EXLab

SET UP AND RUN
The EX1200 series is supported by the popular EXLab turn-key software package. The EXLab's intuitive GUI significantly shortens time-consuming test setup and configuration. Test engineers can begin monitoring recording, and analyzing data within minutes.

With EXLab and the EXI 200 family, engineers can design a mixed-signal distributed measurement system that includes voltage, thermocouple, RTD, and digital inputs.

- Wide range of graphical displays to generate customized views of multiple channels
- Simultaneously Record and store time-stamped data in open data formats
- Easy instrument discovery and connectivity on startup
- Save and import configurations for repeat tests
- Easily configure alarms and triggers
- Simplified options for timing and synchronization
- Self-calibration routines accessible in software
- Calculated and virtual channels supported

## EASY-TO-USE GRAPHICAL CONTROL

The EX1200 series is delivered with an embedded web interface that provides virtual monitoring and control of all switches and instruments without the need for any third-party software.

The web interface is accessible from any web-enabled device, including smart phones and tablets, and provides easy to use tools for test sequencing and scanning. Power on your instrument and start taking data in less than a

| 0.561046 k 2W |  | 5 |
| :---: | :---: | :---: |
|  |  |  |
|  | - |  |
|  |  |  |
|  |  |  | minute.

buILt-IN TEST SEQUENCING
A powerful embedded application dedicated to scanning measurement and control is provided. Each measurement channel can be configured independently with pass/fail limits that can be evaluated on the fly.

Stimulus and switch settings can be modified as part of the test sequence and input channels can be measured to verify how they respond to these changes. This robust utility minimizes processor overhead and test execution time.

## ATE Solutions

## ATE Solution

160 mm

Dual $4 \times 8$; 64 two-wire crosspoints 25 MHz bandwidth
high density switching, instrumentation and i/o

The EX1200 family is the highest density switch and I/O instrument on the market with the ability to mix low-level, power, and
RF switch modules in a single mainframe.
This scalable family of products is designed to leverage capital investments in one common hardware and software platform that can be used in development, manufacturing, and field service.

Mix and match a variety of modules to build a comprehensive signal switching subsystem that can be supplemented with precision analog and digital I/O modules.

XI-BASED EX 1200-4003 2 A MATRIX

DON'T COMPROMISE DENSITY
FOR PERFORMANCE
Typical switch cards that conform to the 34 Eurocard footprint (e.g. PXI) have a limited amount of available working space and manufacturers are often forced to make design tradeoffs between density and performance

To achieve higher channel counts on a PXI card, smaller relays are tightly packed on a switch module. This puts signal carrying traces closer to one another and limits the channel-to-channel crosstalk immunity as well as current carrying capacity.

EXI200 series switching modules offer nearly double the available working space and increased channel count capacity to ensure the highest degree of signal integrity in the same vertical footprint as PXI. For lower density switching applications. VTI also offers a comprehensive family of performance PXI Express switch modules.
treating the signal switch in ate as an instrument
A key factor that differentiates VTI Instruments from competitors is that we view signal switching subsystems as precision instruments and not just a collection of relays on a card. The quality of a switch is not determined by what it does, rather by what it doesn't do; the ideal switch instruments transmit signals exactly as they come in, without attenuating, adding noise, or reducing signal integrity in any way.

With years of experience in designing precision switch instruments and a widespread install-base in virtually every major ATE system world-wide, VTI Instruments has proven that, when it comes to signal transparency, the performance offered by our switch cards is unmatched.

WHY INVEST IN A 6.5 DIGIT DMM WHEN 1.5 DIGITS CAN BE LOST IN SWITCH NOISE?

TYPICAL PC-SWITCH CARD

-     - 60 dB crosstalk @ 100 kHz
- 1 V aggressor adds 1 mV of noise to 10 V signal
- $>30 x$ error when compared to
higher integrity switch card
1.5 digits are lost off a measurement
instrument due to the crosstalk

TYPICAL VTI SWITCH CARD

- -90 dB crosstalk @ 100 kHz
- IV aggressor adds only $31.6 \mu \mathrm{~V}$ noise to 10 V signal
- Maximize full range of measurement instrument capability

## Open Software - Expedite System Readiness

the most significant investment of any automated test
Project resides in the system software. vti's commitment TO DELVERING OPEN ARChtIECTURE SOLUTIONS Extends to software utluties and tools that reduce development time whlle maximizing the flexibluty to choose the application development environment.
flexible application programming options
Every Ex 1200 series module is delivered with an application programming interface (AP) that conforms to industry standard IVI specifications.

The IVI drivers can be used directly in the most common application development environments such as LabVIEWTM, LabWindows/CVITM C++ and Visual Basic. The EX1200 drivers allow a programmer to

- Achieve faster development time through system wide path-level programming
- Plan routine maintenance by automatically tracking relay closures
- Precisely synchronize distributed measurements through IEEE 1588
- Use the LXI Wired Trigger Bus for highly deterministic hardware handshaking
- Auto-instrument discovery using NI-MAXTM and Agilent Connection Expert ${ }^{\text {M }}$
operating system independence
VTI's innovative approach to driver development provides system developers with true OS independence without sacrificing the convenience that instrument drivers deliver.

An IVI-like API can be imported into Linux® and other operating systems. The intuitive APIs simplify programming, making low-level coding unnecessary to access the full capability of the instrument.

BUILT-IN PATH-LEVEL SWITCH CONFIGURATOR
System-level (not just card level) I/O can be logically named such that an entire path consisting of multiple relays can be connected with a single function call. On-board intelligence ensures that there are no conficts with shared resources. With the EXI 200 family there is now need for expensive switch configurator utilities.
${ }^{\circ}$ $\qquad$

A software interface for each switch module
with no system-level knowledge increases
A software inferface for each switch modue
with no system-level knowledge increases
coding effort.

$\stackrel{\rightharpoonup}{r}$

CONFIDENCE CHECKING
Internal feedback provides assurance of relay closure
extensive triggering
Extensive hardware and LAN-based handshaking with other system devices increases test throughput by limiting communication with a host PC.

AUTOMATIC SCANNING
Predefined channel lists can be stored on-board to simplify programming setup and reduce test execution time

## SAFETY INTERRUPT

This failsafe feature forces all relays to a default state in the event of a fault condition. This allows hazardous voltages to be automatically removed from the interface panels.
programmable timing delay
Delays can be programmed into the modules to account for the settling of other system devices. When used with triggers and scan lists, a highly deterministic measurement system can be easily configured.

relay health monitoring
A relay odometer keeps track of the number of times a relay has been actuated and can be used to predict routine maintenance. Switch self-test is supported on select switch instruments and tracks path resistance across relays to monitor relay health

## Connectors and Cabling

protecting signal integrity end-to-end
The performance of a switch system goes beyond just the relays and the switch card PCB. Everything in the signal path, including the cabling and connectors from the DUT and to the measurement instruments, can add noise and degrade the signal.

VTI optimizes the system-level performance by providing easy to use connectivity options that minimize signal loss.

CRIMP/POKE SIMPLIFIES CABLE CONSTRUCTION INCREASES DURABILITY

WIRES TERMINATE DIRECTIY INTO CONNECTOR, MAXIMIZING PERFORMANCE 22 AWG WIRE ALLOWS FOR 2 A CARRY INCREASED PIN SEPARATION EXTENDS VOLtAGE RATING TO 300 V

TYPICAL PC HIGH-DENSITY CONNECTOR

PC BOARD REQUIRED FOR SUCCESSFUL termination

NOT RECOMMENDED TO BE BULLT BY END USER ADDITIONAL CONNECTION POINT INCREASES insertion loss and adds another point of FAILURE

MAXIMUM 28 AWG WIRE RESTRICTS CURRENT CARRYING CAPABILITY TO 1 A CARRY

MINIMAL PIN SEPARATION LIMITS SWITCHED Voltage to 100 V

CONNECTORS AND ACCESSORIES

For each product in the EX1200 series, VTI Instruments offers a range of connectivity options that give users different options to interface to the instruments. There are four basic types of connectivity options:

discrete accessories PRE-ASSEMBLED CABLES terminal blocks INTERFACE TEST ADAPTERS
discrete accessories

VTI Instruments offers discrete components for all its connectors that allow users to build their own cable assemblies. This includes:

mating connectors
STRAIN RELIEF ACCESSORIES
CRIMP TOOLS
CRIMP PINS
teflon/pvc coated wires
insertion and extraction tools
hoods/COVERS
NYLON SHROUDS
pre-Assembled cables

VTI Instruments offers fully assembled cables that have mating connectors on one end and loose wires on the other end. Different options for cable length are available for many of the connectors.

Interface test adapters
Interface test adapters are used in automated test stations to interface between test instruments in the test rack and the device under test. VTI offers pre-configured mainframes with interface receivers and all associated cabling and wiring. Please refer to VTI's creatEX series data sheets.

Integrated 18-sIot PXI Express/EX1206A mainframe with pull-through receiver Integrated 18 slot PXI Express/Ex1208A mainframe, with cabled receiver

PXI EXPRESS SWITCHING
For applications where the channel counts for signal switching are not large, VTI offer the SMX series - a broad range of "precision instrumentation grade" switch modules on the PXIe platform

The SMX series is an extension to the EX1200 series, and can be controlled using the same instrument drivers. This allows smaller systems within PXI to be upgraded, or larger systems to be downsized very easily.

Unlike traditional PXI switch modules available in the market that pack relays onto cards to maximize density while ignoring performance, SMX series is designed with VTI's core phillosophy of high-density without compromising on performance.

- Best-in-class signal switching performance on PXI/PXIe form factor
- PXIe as opposed to PXI - mitigates obsolescence and is based on faster, newer, and forward looking instrumentation plafform
- Relay health monitoring and self-test within matrix cards
- Software benefits - path level switching, confidence checking, and safety interrupts

PXI EXPRESS SWITCH MODULES

| SMX-3276 | 76 channel, dual (1x38) 2-wire, 300V/2A multiplexer |
| :---: | :---: |

EX1 200-21 65 | 2365 DMMs

## VERVIEW

- Modular 6.5 digit DMMs for the EX1200 mainframes
- Tightly integrated into mainframes, allowing high-speed, synchronized scanning measurements without the need for external cabling
- Input can be routed directly to the DMM or through an internal analog bus on the backplane.
- Super fast scanning with no processor intervention required
- Scanning configuration can be saved in the DMM's non-volatile memory allowing quick recall of saved states
- Integrating ADC for with adjustable integration time depending on the level of accuracy required.
- "True RMS" AC readings
- Frequency and temperature measurements

## EX1 200-1538

Multifunction Counter, DAQ, and DIO

APPLICATIONS
Single frequency measurement range from 0.05 Hz to 1 MHz

Tooth wheel RPM measurement
Measure position and speed from quadrature encoder signal

Wide range of measurement
functions makes this ideal for both electronic functional
test and data acquisition

General Specifications
frequency counter inputs

ON-BOARD MEMORY
averaging methods
APERTURE TIME WINDOW

## FEATURES

- 8 frequency counter channels, 16 isolated digital I/O 2 isolated DAC channels per card
- Highly stable 50 MHz , TCXO base clock along with 32 -bit counter for frequency measurement
- Counter channel accepts both analog and digital inputs with $\pm 48 \mathrm{~V}$ differential input range eliminates need for signal conditioning in most applications
- Programmable hysteresis and threshold levels
- Isolated digital
- Precision isolated 16-bit current or voltage source

## 8 (analog/digital)

## EX1200-7416

Comparator/Event Detector/Time Stamp

Constantly monitor input for fault conditions

Detect edges, out-of-bound condilions, and measure pulse widths

Can be used as a timestamp module and as a Digital I/O
"Go/no-go" tests where device needs to perform within a certain window

Control applications where device or test needs to be shut down if a threshold is exceeded

## EX1 200-ICA Solutions

Integrated ICA and Switching Mainframe
features

- Integrated receiver and switch modules eliminate lossy cabling
- 14 high-density switch and I/O slots
- Integrated analog backplane expands measurement capability
- Matrix switching allows for flexible use of receiver I/O
- 270 V dc power option

The EX1200-ICA is an 8 U signal switching mainframe with 6 U tall plugin cards with integrated receiver modules. It is used at the core of the US Navy CASS program as the enhanced general purpose interface subsystem.

These receiver modules greatly simplify cabling and maintenance, and also improves performance by eliminating cable losses between switch system and receiver.

The EX1214-ICA has access points in the rear that can be used to interface the I/O to internal test system resources such as spectrum analyzers and RF synthesizers. It also has a removable power supply that supports AC/DC inputs with remote enable/disable.

| Ex1214-ICA | 14-Slot, 8 U mainframe |

CUSTOM INTEGRATION SERVICES
VTI employs an innovative, modular approach to our standard product designs that allows us to quickly make customer-requested modifications that address specific application requirements. These 'custom' products are then documented and supported just like our standard products. This relieves our customers of the burden of managing a custom development project and the associated long-term support issues, while helping them optimize their size and overall cost.

SYSTEM-LEVEL EXPERIENCE
Our application engineering team has years of experience in integrating a wide range of instrumentation products into larger test systems. We work with customers during the project definition phase to help architect solutions that best meet the application requirements. Our expert knowledge of industry standards, such as LXI, VXI, IVI, PXI and VME, at the hardware and software level has helped test developers reduce the time to 'system readiness' in the following applications:

- data AcQuisition
- functional / Automated test
- signal switching and distribution

It is with this experience that we are able to provide our customers with a world-class selection of automated test and data acquisition solutions.

## SERVICE AND SUPPORT

VTI Instruments has a worldwide sales, service, and support infrastructure, along with a staff of applications and technical sales people who have years of experience configuring and specifying test requirements. By utilizing state-of-the-art technology in all phases of product development, VTI Instruments is able to provide a level of worldwide support that is unique in the industry.

VTI is committed to preserving our customers' initial capital investment in our products through a dedicated sustaining engineering program that continuously designs out component obsolescence. This approach enables us not only to enhance products, but also to considerably extend their life and support cycles. We strive to maintain hardware and software backward compatibility with our installed base whenever possible so as not to impact our customers' existing test program sets.
